ScottishPower Cyber Security Game

Cyber security is not only about technology. It is also about how people make decisions, work together and respond when something goes wrong.

ScottishPower has developed a tabletop cyber security investment game. Players manage a £3 million budget, select security controls and see how their choices perform against a series of incidents. The challenge is to turn it into a more engaging, educational digital experience.

Teams will create one complete, playable scenario in which security investments and human decisions have clear and explainable consequences. Players should have opportunities to practise good security behaviours, work through uncertainty and understand how their decisions affect colleagues, incident response and the wider business.

A reference browser-based prototype will be provided. Teams may extend it, reuse selected components or build a completely new implementation. All approaches will be judged equally. The prototype is an exploratory starting point intended to better illustrate the game, not a finished product or a suggested technical architecture.

In addition to the core experience, teams will develop advanced capabilities drawn from:

- a dynamic simulation in which investments and actions change cyber and business outcomes;
- cooperative multiplayer in which participants hold different information or responsibilities;
- a bounded AI incident director that adapts the experience within clearly defined limits; or
- replay and optimisation tools that help players compare alternative decisions and budget choices.

Teams will use an approved scenario and control catalogue, test their solution with users and demonstrate both technical depth and business judgement. They should explain what they improved, why those improvements matter and what limitations remain.

The goal is engaging and explainable software that helps people practise better security decisions; understand why their choices matter and work together effectively. The strongest solutions will also demonstrate a credible route towards becoming a maintainable cyber security learning resource for ScottishPower.
